

PARKING CONTROL IN A BOX

A convenient, reliable, and cost-effective standalone parking control system

The GAO RFID Standalone Parking Control System is a parking solution that provides the 24-hour unmanned operation of parking gates that automatically grant access to vehicles to and from your parking facility. This standalone system does not require any networking or programming; everything that is required is embedded right in the box and is ready to be installed.

Product #617018P shown

Product Snapshot

The GAO RFID Standalone Parking Control System is a reliable, convenient and user friendly way to control parking lot access. It is an "In a Box" solution that includes the software, antenna and all other peripherals such as the digital I/O. These components are interfaced together and embedded right in the box which can be installed to automate barrier lift arm, slide, and swing gates at parking lot entryways. With our Parking Control Management Software installed on a desktop computer, you can activate and administer the tags with the required vehicle information. Using a simple USB stick, data exchange and software upgrades are easily conducted. This results in a compact, convenient, and cost-effective parking control solution that can be installed within minutes without the worry of networking and extensive programming. Parking Control in a Box—a simple and effective way to control parking lot access, no matter how remote the location!

STANDALONE PARKING CONTROL SYSTEM FEATURES

Control and restrict the use of parking lots

24-hour unmanned operation; set it, then forget it!

The power of UHF technology means vehicles can be identified up to 5 meters away

Group Management gives the ability to control multiple zones simultaneously

Access History Logs to see who has entered the parking lot and when they exited

The option to sync information to give you real-time data on your Management PC

HOW IT WORKS

TAG MANAGEMENT

Add, edit, and remove tags from the system or organize tag holders into groups to further restrict access to different groups at different times.

PARKING CONTROL

When a tag enters the reading range, the system reads the tag and authenticates it by checking the tag list stored on the reader. On successful authorization, it grants access and logs entry/exit information into the database.

READER MANAGEMENT

Readers can be configured using a PC and all logged data stored on the readers can be retrieved ensuring 100% visibility of your parking lot's usage.
